SUMMARY

Sixteen years in web development, the last three leading frontend teams. Fintech, marketplaces, education, sport and media; products with millions of users, and products grown from an empty repository to release. I set up how a team ships — architecture, review, CI, the conversation with design and product — and I still write and read code every day.

How I work in 2026. Coding agents (Claude Code) write most of the lines; my job moved to the parts that decide whether the result is any good:

- the architecture and the boundaries — what the system may do, what it must never do, where data lives;
- reading every change before it ships, and testing it the way a user would, not only the way the code expects;
- keeping it cheap and boring to run: no servers where a static page will do, no tokens spent when nothing changed.

The projects below were built this way, in days rather than weeks.

SELECTED WORK, 2026

Messenger archive and a daily triage board

Personal system on a home server · Node.js, SQLite, Docker, MCP, whisper.cpp

- Two WhatsApp accounts and Telegram archived into SQLite; voice notes transcribed locally on the integrated GPU (Vulkan), no audio leaves the house.
- Read-only MCP servers let an AI assistant search years of chats; sending is off by default, limited to saved contacts, rate-limited and logged, because every message an assistant reads is someone else's input.
- A triage board fills itself: a headless agent runs only when private chats go quiet after new messages, sorts what needs a reply, and never retells what I wrote myself. Past events clear away on their own.

Ігротека — a board-game library for a group of friends

boardgames.olegsuv.dev · Netlify Functions and Blobs, Telegram bot, BoardGameGeek

- Moved from a spreadsheet rebuilt by an AI every hour to a static page with one function over a key-value store; concurrent edits are safe through ETag-conditional writes.
- Sign-in through a Telegram bot: a one-time code, the bot's webhook, a signed session — friends own their entries without passwords.
- A worker on the home server identifies new games and writes their descriptions; it asks the site for free and runs a model only when there is something new, once per batch.

Home infrastructure

Ubuntu, Docker, Cloudflare Tunnel and Access, Tailscale, restic, Immich

- Home services published through Cloudflare Tunnel with no open ports; private pages behind Cloudflare Access, with the app verifying Access's signed token itself rather than trusting a header.
- Family photo library (Immich) with face recognition offloaded to a desktop GPU during the first import.
- Backups to relatives' PCs through append-only repositories, so a compromised server cannot delete them.

EXPERIENCE

Frontend Lead · NDA (fintech), remote
03/2024 – present

Finance software for processing bank transactions: a React SPA on Vite, Ant Design and Styled Components.

Frontend Lead · 1000Farmacie, remote
02/2023 – 02/2024

Joined a fast-growing marketplace to lead the frontend: built the team's development process, fixed the build at its foundations, upgraded the stack and SEO — with a measurable lift in revenue — and integrated Google Ads, Meta Pixel, OptiMonk and Clerk personalisation.

Senior Frontend Developer · Svitla Systems, remote
01/2019 – 12/2022

- **CreateMe** — a kiosk application for ordering in real time; kiosk and standalone modes for the US and UK rollout.
- **Noodle** — new features for an education platform, and a development process that made releases predictable.
- **Clearstream / Deutsche Börse Group** — a client-critical portal: automated upload and validation, security and performance work.

Senior Frontend Developer · Infront X (formerly Omnigon), Kyiv / remote
02/2015 – 12/2018

- **PGA Tour** — moved the site's components from jQuery to React; 99.8% unit-test coverage.
- **Corebine CMS** — led a small team building a CMS for sports websites from scratch.

Frontend Web Developer · NOOSPHERE, Ukraine
09/2014 – 01/2015

An internal single-page application for a support team; migrated it from Ext JS 4 to Ext JS 5. Before that, freelance web development.

SKILLS

TypeScript · React · Next.js · Node.js · Vite · Webpack · Redux · Ant Design · Material UI · Styled Components · SCSS · Jest · CI/CD · Docker · Cloudflare · Netlify · SQLite · MCP · Claude Code · GA4 / GTM

EDUCATION & LANGUAGES

Master's degree, Computer Science — National Metallurgical Academy of Ukraine.

Ukrainian — native · English — professional · Spanish — elementary.
